

Zeus S90 Pregafer

[Rif.: #023]

The S90 beach cleaner is a self-propelled track-driven machine, ideal for cleaning sandy areas. The speed of the machine and the operation of the sieve they are independent of one another through a HYDROSTATIC system that makes it unique in the sector unlike traditional mechanical transmission machines.

It is an easy to handle Beach Cleaner that lends itself very well to working in small and large spaces and even under umbrellas thanks to its very low structure. Thanks to our innovative system, the progress, the reverse and the steering take place hydraulically, making the machine easy and efficient and considerably reducing the operator's fatigue during beach cleaning operations.

The machine is equipped with a fixed blade, manually adjustable, which, at the required depth, collects sand, debris, shells, cigarette butts, bottles, glasses, stones, beached algae, etc. These will be conveyed on an oblique sieve with alternating movement, which will allow the waste to be deposited in a collection container and the clean sand to fall. Included are three types of sieves: one with finer mesh, one with medium mesh and one with large mesh, easily interchangeable.

The parts subject to greater wear are hot-dip galvanized, the rest of the machine is painted with cataphoresis treatment. Beach cleaning made according to the CE Regulations.
